

The Alert Generation System is desinged to provide realtime monitoring and routing of patients using a modular and extensibile architecture The core of the System are primarlily Alert Alertgernerator and AlertManager. To make sure each person has personalized Thresholds and AlertStrategy the System uses a Strategy Interface with the specific Strategys for different criteria as BloodPressure and HeartRate with independent different Thresholds this Design makes it easier in the end to implement new Strategies for new criteria

During realtime evaluation the Alertgenerator uses constantly the Data from DataStorage and evaluates the data based ion the Threshold Interface if something is off it creates an alert and notifys AlertManager to dispatch it to Staffl.
